

## Abstract of Disclosure

An integrated double-sided organic light-emitting display includes a substrate on which a main-panel, a sub-panel, and a control module are installed. The  
5 main-panel is used for generating a main-image light, which progresses along a first display direction. The sub-panel is used for generating a sub-image light, which progresses along a second display direction, and the first display direction and the second display direction are mutually reversed directions in free space. The control  
10 module is electrically connected to the main-panel and the sub-panel for controlling operations of the main-panel and the sub-panel.
